2010

Some insights into RNA
Architecture

RNA Folding

is modular & hierarchical

- 1/ Formation of helices, hairpins
- 2/ End-to-end stacking, parallel packing of helices
- 3/ Formation of tertiary contacts (helix/loop, loop/loop,...)

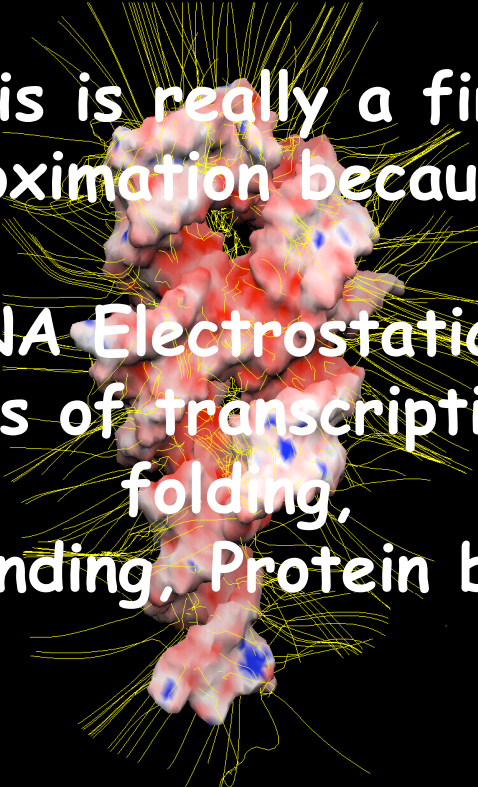

RNA Folding

Stacking of bases
and
base-base H-bonding
are both key for RNA architecture

Structure of the SAM-II riboswitch bound to S-adenosylmethionine

Gilbert, Rambo, Van Tyne, & Batey, Nature Struct & Mol Biol 15, 177 (2008)

This is really a first approximation because of
RNA Electrostatics,
Kinetics of transcription and folding,
Ion binding, Protein binding

An ontology for base pairing

- **Watson-Crick pairs (digital mode)**
 - Form standard RNA helices
 - Define the 2D structure
- **Non-Watson-Crick pairs (analog mode)**
 - Form 3D RNA modules
 - Responsible for RNA-RNA recognition & 3D fold

Three Interacting Edges

Interacting Edges

Edge-to-Edge Pairing Families

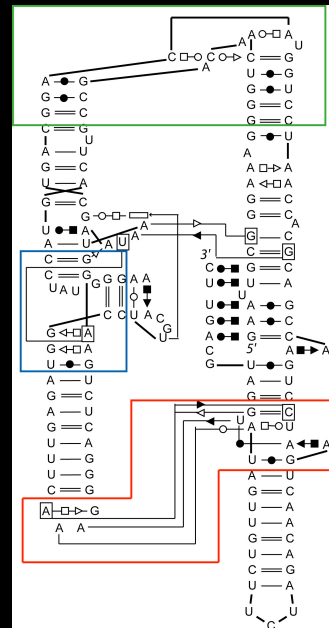

= 12 Basic Families

RNA 7, 499 (2001)

Each structure can be parsed in modules that are recurrent in various RNAs

Bases forming base pairs

cWW base pairs and no non-cWW base pair 52%

cWW base pairs and at least one non-cWW base pairs 7%

At least one non-cWW base pairs and no cWW base pairs 20%

Bases forming other interactions (no base pairing)

Base-stacking and base-phosphate interaction 13%

Base-stacking only 3%

Base-phosphate only 1%

Bases forming no RNA-RNA interactions 4%

Total 100%

Those recurrent non-Watson-Crick base paired modules

- produce helical variations and bending within helical domains
- organize locally junctions and helical domains
- participate in long-range RNA-RNA interactions between domains
- bind small ligands
- participate in RNA-protein interactions

A **MODULE** is an ensemble of ordered non-Watson-Crick base pairs.

The assembly Modules

Those recurrent non-Watson-Crick base paired modules

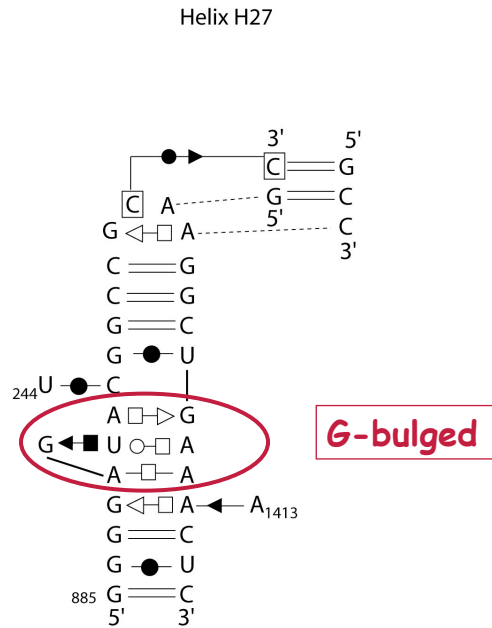

- produce helical variations and bending within helical domains
- organize locally junctions and helical domains
- participate in long-range RNA-RNA interactions between domains
- bind small ligands
- participate in RNA-protein interactions

Organization of an internal loop

Participation in long-range
RNA-RNA interactions
between domains

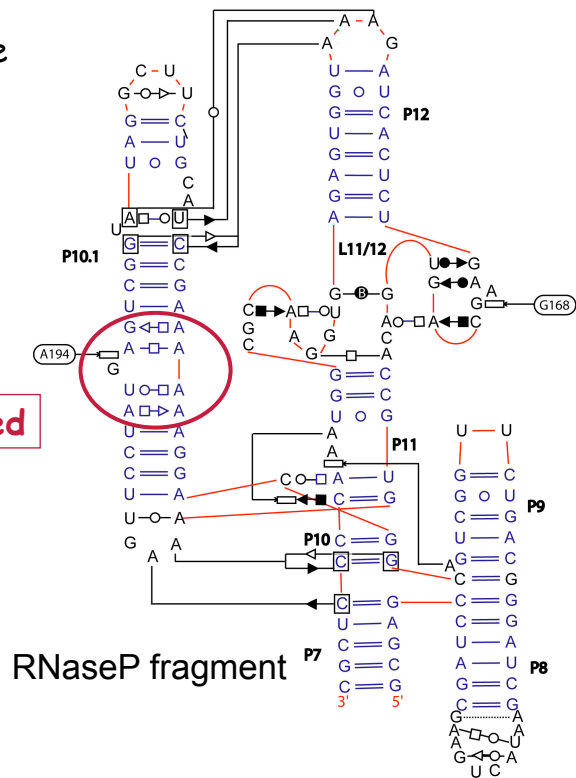

16S rRNA

Relative distances between modules

Participation in long-range
RNA-RNA interactions
between domains

The key RNA self-assembly modules

-loop / loop -

-A-minor modules -

The self-assembly modules

Sequence-based : Watson-Crick base pairs

- guide sequence,
- loop-loop,
- pseudoknots

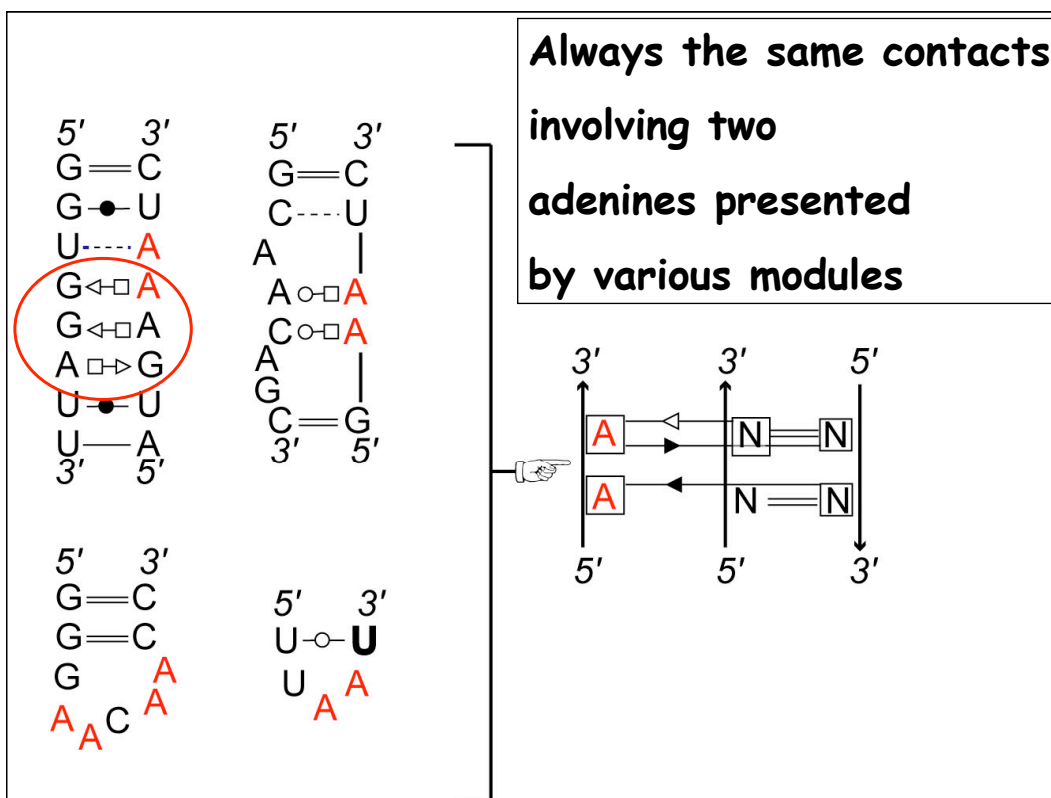

Backbone-based : A-minor interactions

Non-specific : between sugar-phosphate

Ribose zippers ($O2' \dots O2'$; $O2' \dots N3(R)/O2(Y)$)

Specific on one side : $5'AA3'$... WC pairs

Highly specific : GNRA...WC pairs/11nt-modif

GNRA - helix/receptors

GYGA CCAGUUGGCC [] GGGGCGACCCC [] GGCCAACUGG
 AGAGUCGAUU [] GGGCGUGAGCCU [] GAUCGACUCU

GYAA CAGGAUAGGG [] CGGGGCAACCCG [] CCCUAUCCUG
 CGGGACGAGG [] CGGGGUAACCCG [] CCUCGUCCG

Variants of GNRA type of contacts

Most common
TypeI/TypeI

GNRA

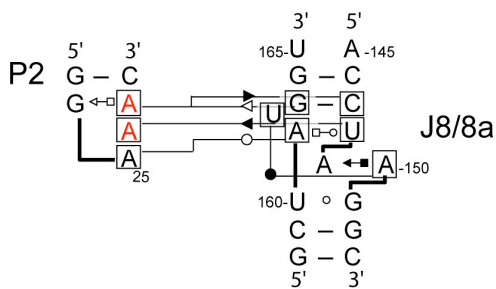

GA tandem

A-rich bulge

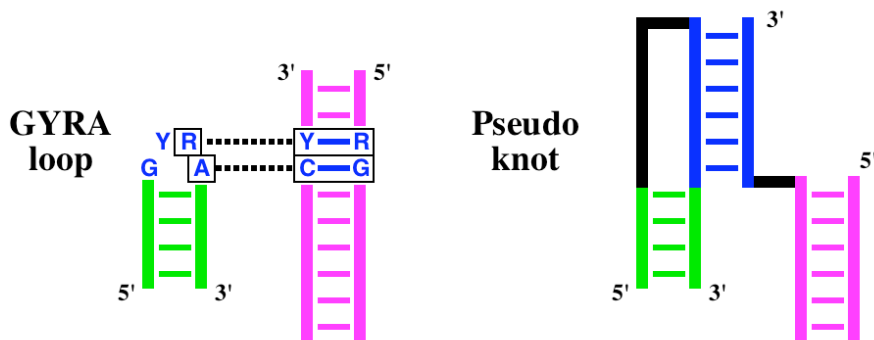

A more complex variant: The 11nt-motif interacts with GAAA tetraloop

Motif Swap between GNRA/helix and loop-loop motifs

GYRA loop AGAGUCGAUU [] GGGC----GUGAGCCU [] GAUCGACUCU----

 between helices

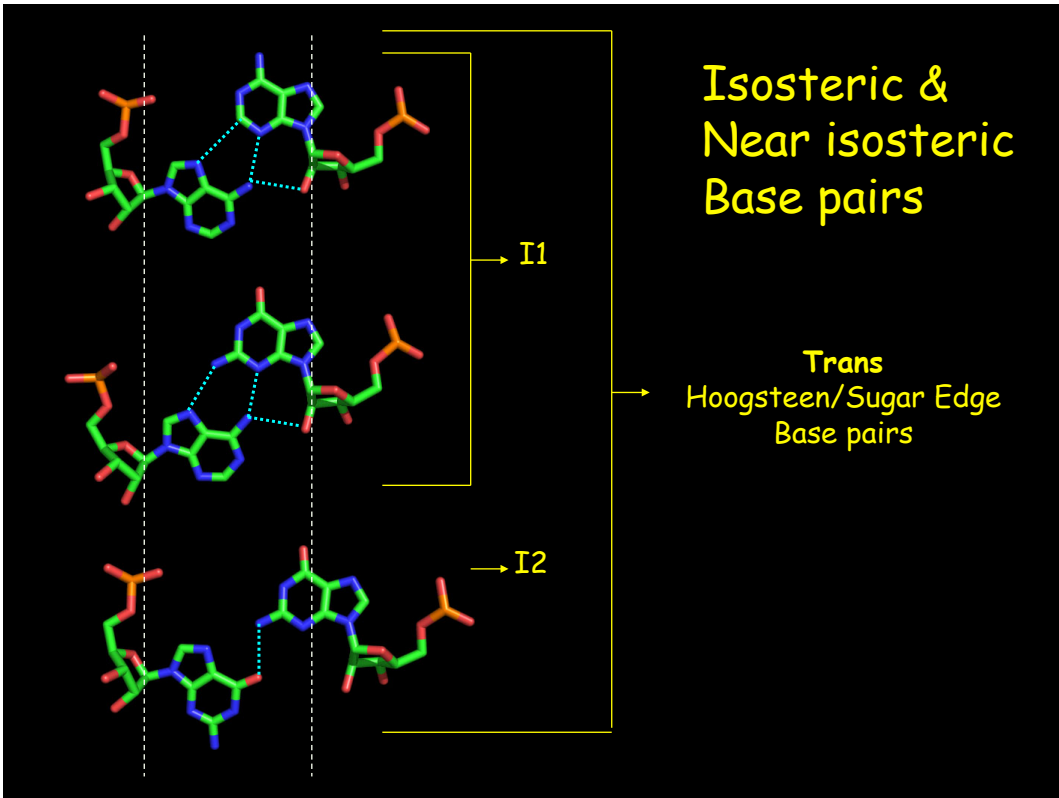

Which sequences are compatible with a given module?

Isostericity Matrices

12 pairing families >> 12 isostericity matrices

Watson-Crick	Watson-Crick					Watson-Crick	Watson-Crick					Hoogsteen	Hoogsteen					Hoogsteen	Hoogsteen				
	<i>cis</i>	A	C	G	U		<i>trans</i>	A	C	G	U		<i>cis</i>	A	C	G	U		<i>trans</i>	A	C	G	U
	A		●		●		A		I ₃		●		A			●			A	●	●	●	●
	C	●		●			C	I ₃		●			C			●			C	●		●	●
	G		●		●		G		●		I ₃		G	●	●	●			G	●	●		
U	●		●		U	●			I ₃	U					U	●	●						
Watson-Crick	Hoogsteen					Watson-Crick	Hoogsteen					Hoogsteen	Sugar					Hoogsteen	Sugar				
	<i>cis</i>	A	C	G	U		<i>trans</i>	A	C	G	U		<i>cis</i>	A	C	G	U		<i>trans</i>	A	C	G	U
	A						A						A	●	●	●	●		A	●	●	●	●
	C		●	●	●		C	●	●	●			C	●	●	●	●		C	●	●		●
	G						G						G	●		●	●		G			●	
U	●		●	●	U	●				U	●	●	●	●	U	●		●					
Watson-Crick	Sugar					Watson-Crick	Sugar					Sucrose	Sugar					Sucrose	Sugar				
	<i>cis</i>	A	C	G	U		<i>trans</i>	A	C	G	U		<i>cis</i>	A	C	G	U		<i>trans</i>	A	C	G	U
	A	●	●	●	●		A	●	●	●	●		A	●	●	●	●		A	●		●	
	C	●	●	●	●		C	●	●	●	●		C	●	●	●	●		C	●		●	
	G						G		●		●		G	●	●		●		G	●		●	
U					U					U	●	●	●	●	U	●		●					

The module diversity is not simply the combinatorics of the isosteric base pairs

Loop E Motif in 16S rRNA (h20)

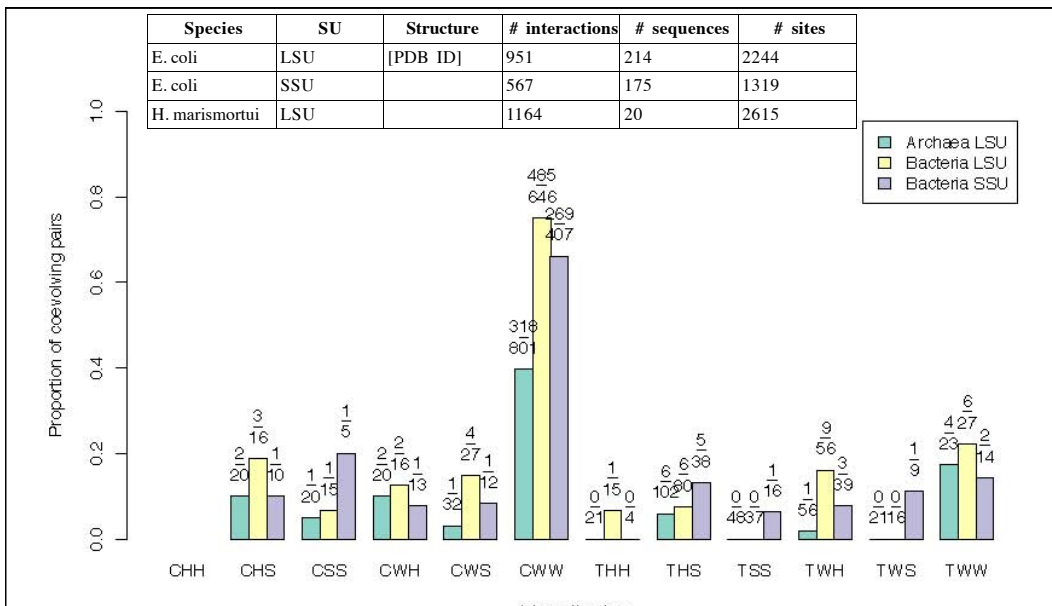

Thermus th.

E. coli

Are all base pairs evolving similarly ?

- ▶ Only ~ 20% of non-WC interactions show a significant coevolutionary signal,
- ▶ Whereas more than 60% of WC pairs are coevolving.

In **coevolution**, a change from one state to the other implies a simultaneous substitution event at a different position.

Neutral networks connect different sequence states, distant by only one mutation, that possess the same fitness.

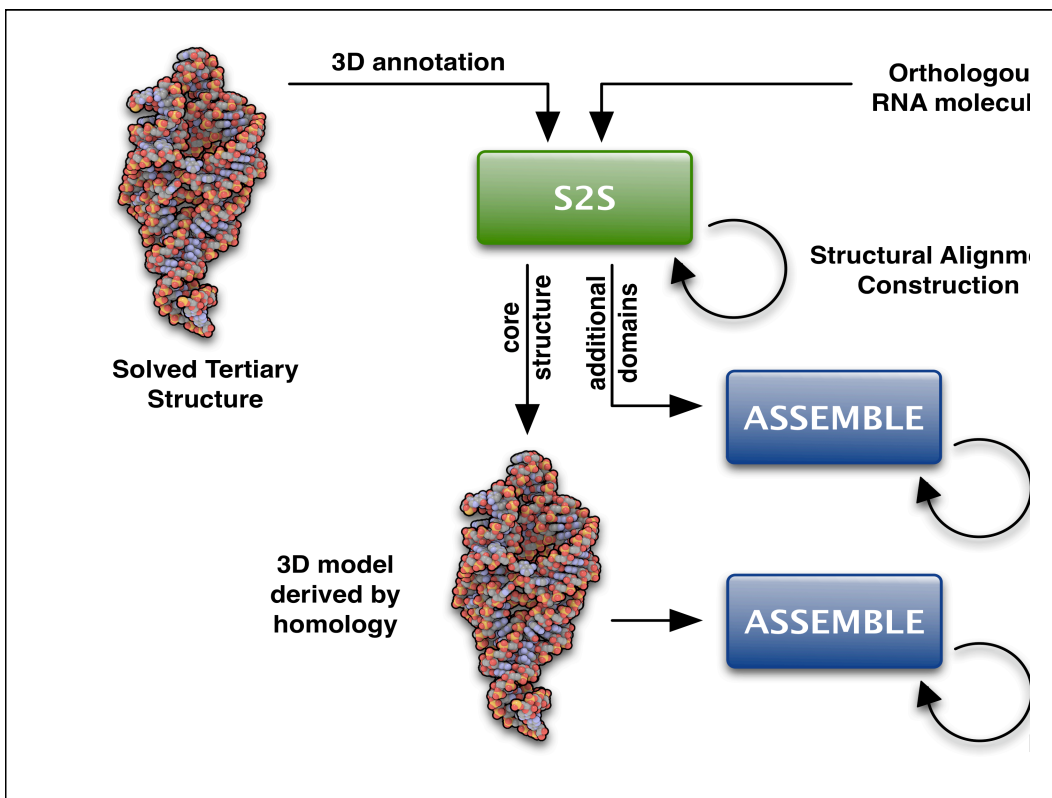

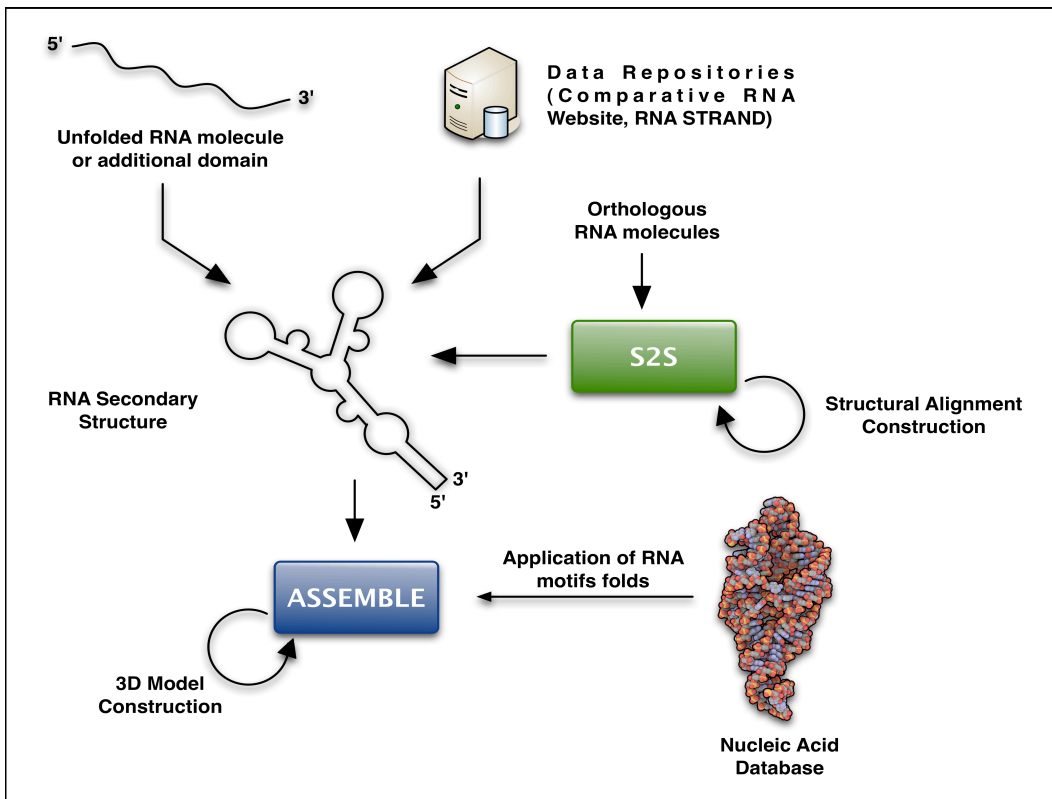

Conclusions

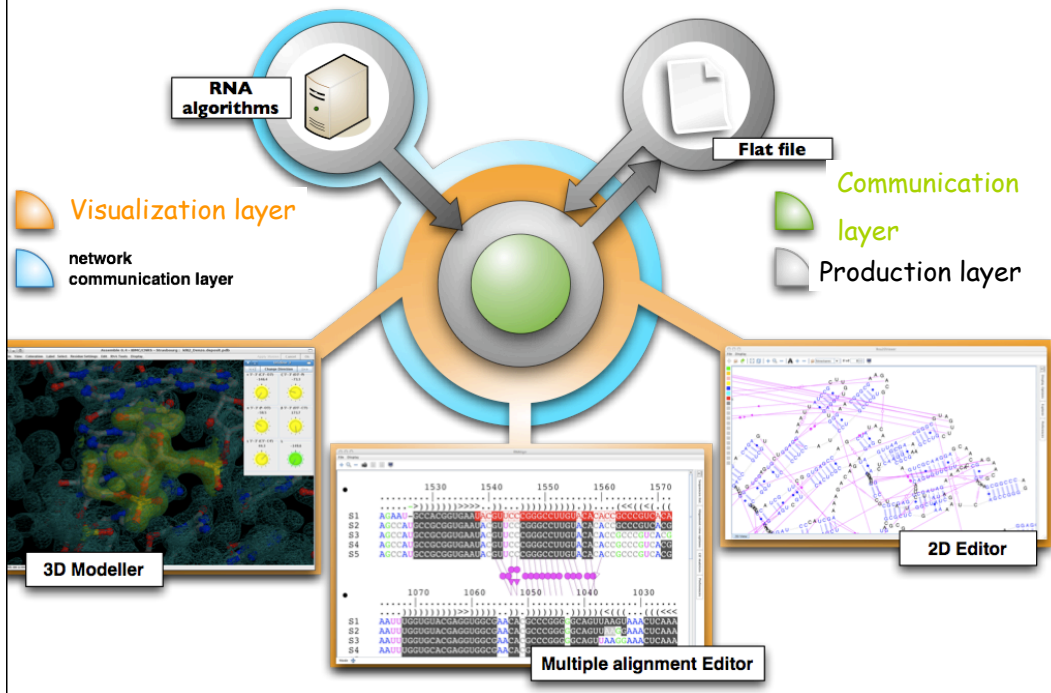

1. The *cis*-*WW* pairs have a very high substitution rate and the highest proportion of coevolving pairs.
2. The *non-WC* pairs display a lack of co-evolution signal.
3. Existence of neutral networks (based on isostericity matrices) decoupling the evolution at interacting sites.
4. Lead to lack of 3D signal in sequences.

Modelling

by modular assembly
